IS ALL WE KNOW 619

Your AI Stack, Explained

A free orientation: repositories, models, skills and tools.

Learn freely. Build deliberately.

A practical workbook for beginners who want repeatable results. Original exercises, decision tools and templates. English edition / November 8, 2026.

What you will build

Four pieces, four different jobs

Four pieces, four different jobs

Repository: the project files and their history. It may contain an application, examples, prompts, documentation or a model loader. A repo is not inherently a running service.

Model: the system that generates or classifies content. It needs a runtime and resources. A small local model and a cloud model may have very different capabilities.

Skill: a reusable task contract, sometimes packaged with examples and supporting files. A compatible host must discover and apply it. A skill does not add new trained knowledge or automatically grant tools.

Tool: a capability such as reading a file, searching or calling an API. The host controls its access. Giving an agent a task does not make unavailable tools exist.

Example: a project repo contains a note-review app. Ollama runs a model. A review skill defines the checklist. A file tool supplies a note. You judge the output against the checklist before using it.

First exercise: choose one harmless note, define a three-item output and test manually. Only automate after you can recognize a correct result.

Your next step

Need to evaluate project code? Use the GitHub Repo Field Guide. Need repeatable instructions? Use the AI Skills Workbook. Need a local model and a troubleshooting sequence? Use the Local AI Starter Lab. Paid guides are optional companions; the academy courses and labs remain free.

Free learning: https://isallweknow619.com. Optional business-agent platform: https://ceolabs.tools. No paid membership is required for academy learning.
