DECEMBER 2026 | EDITION NO. 04

THE EXECUTIVE FRUSTRATION BRIEF

What business leaders are struggling with and what it means.

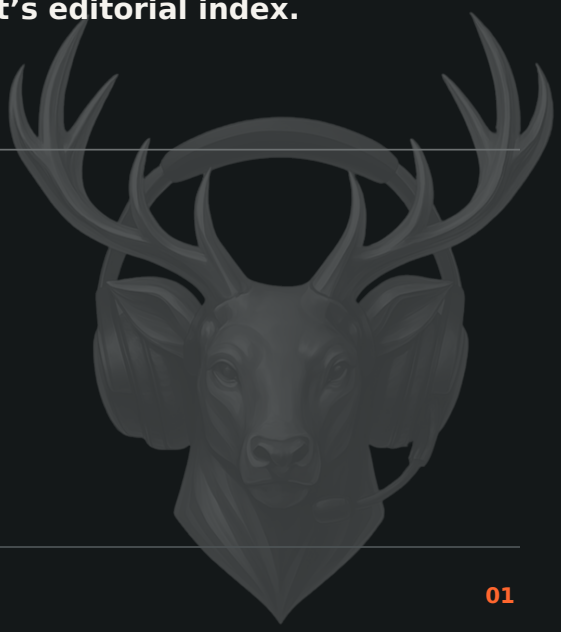
Before you scale AI, prove the workflow works.

A workflow has to carry trusted information, decision authority and customer context through to a result the business can defend.

7 → 3

Data and integration rose from seventh to third in the closing week of ParkWest's editorial index.

EDITORIAL PRIORITY / NOVEMBER 13–19 TO NOVEMBER 20–26



EVIDENCE WINDOW

October 30–November 26, 2026

What should leaders prove before they scale AI?

Prove that one workflow produces an accepted business or customer outcome at a cost the business can defend. Use representative cases, including exceptions. Verify that the people and systems doing the work have the right information, that an accountable leader can intervene and that the result can be traced.

ParkWest analysis / The proof now has to travel

September identified execution debt as AI capability grew faster than work was redesigned. October put the customer consequences of that debt in view. November asked leaders to prove the changed workflow earned its cost. This issue adds a practical test: can the facts, policy, authority and history required for a decision reach the next person or system, intact and in time?

ParkWest observation / Financial proof held first place

Across all four weekly reports, defensible financial proof ranked first. Consumption economics moved to second in the second cycle and stayed there. In the closing week, data and integration rose to third, while agent accountability remained fourth. This is a change in the evidence ParkWest prioritized during the period.

External findings / Outcomes vary by workflow

Gartner reported that 4% of customer service organizations achieved their expected AI ROI in a survey of 275 service and support leaders [1]. Airbnb reported that about 40% of its Q3 support issues resolved without a human agent and that support cost per booking decreased more than 17% year over year [2]. These two sources use different measures and populations. Airbnb gives leaders a concrete operating result to investigate in its own context.

The December decision

Before renewing, widening or automating a workflow, ask for its baseline, accepted outcome, full delivery cost, handoff evidence and the name of the person who can change or stop it.

Four weeks of operating signals

Rank within each weekly ParkWest editorial index. Lower rank numbers indicate higher editorial priority.

Tracked frustration	OCT 30–NOV 5	NOV 6–12	NOV 13–19	NOV 20–26
Financial proof	1	1	1	1
Consumption economics	4	2	2	2
Workforce redesign	2	5	3	5
Customer trust and recovery	3	4	5	7
Agent accountability	5	3	4	4
Data and integration	**6**	**6**	**7**	**3**
Audit and assurance	8	7	6	6
Third-party AI and identity risk	7	8	8	8
SMB adoption and payback	9	9	9	9
Sales pipeline reliability	10	10	10	10

Oct 30–Nov 5 / Customer service is the clearest test

Workforce redesign and customer trust ranked second and third. Customer service evidence showed the range from unmet expectations to a company reporting measurable gains.

Nov 6–12 / Cost and ownership move up

Consumption economics moved to second and agent accountability to third. The evidence gave leaders more reason to measure the cost of safe delivery and name a production owner.

Nov 13–19 / Workforce redesign returns to the top tier

Workforce redesign reached third. Worker involvement, training and the people who inherit exceptions mattered to the operating case.

Nov 20–26 / Context becomes a priority

Data and integration moved from seventh to third, with its score rising from 97 to 100. Workforce redesign and customer trust changed rank as the evidence mix shifted. Their movement does not establish improvement.

Three ways to test the operating case

Use the evidence to decide which workflow to change, which safeguards it needs and what to measure.

1. Measure cost per accepted outcome

Capgemini found that nearly three in five surveyed large organizations exceeded AI budgets. Among those that did, the average overrun was 24% [3]. **ParkWest analysis:** Record model usage, integration, review, exception handling and recovery. Divide the cost by outcomes that met the agreed quality and customer standard. Compare with the current workflow, with similar case mix and service levels.

2. Put trusted context at the decision point

Experian’s survey of 500 decision-makers in large UK and Ireland organizations classified 17% as context-ready under its definition of access to both data and business context [5]. **ParkWest analysis:** Test whether the current policy, prior actions, customer commitments and case history reach the person or system making the decision. A failed handoff can turn an apparent saving into repeat work and additional customer effort.

3. Give people a role in redesign and clear authority

Adecco found higher reported willingness to adapt among workers who were involved in redesigning their work [4]. The IAASB’s initial guide frames quality management for AI-enabled tools in audit and assurance [6]. **ParkWest analysis:** Involve frontline staff in designing the revised process and test who can review, override or pause a specific task, what gets logged and how the team restores service.

For a business with limited capacity

Choose one recurring problem with a named owner. Compare a process fix, a rules-based change and AI assistance. Start the lowest-risk useful work while closing critical gaps. Set a date and condition for reassessment, and consider the cost of another month of delay.

Six questions for leadership

Use the signal that matches the decision you are about to make.

AI Spend No Proof

Agree on one accepted outcome and its full cost.
What result would justify the next dollar?

Demo vs Production

Test with real inputs, exceptions and a working fallback.
Can this safely perform the assigned task in production?

Where Did the Time Go?

Measure verification, exceptions and where recovered capacity goes.
What changed in backlog, quality or capacity after review work?

Who Owns the Stop Button?

Give a named owner authority to pause the workflow and test takeover.
Can someone stop it and recover the last affected case?

The Handoff Breaks

Send the receiving person the case history, applicable rule and authority to act.
Can the customer get help without starting over?

Twenty Ideas, No First Move

Compare AI assistance with simpler fixes and choose a bounded test.
Which workflow is worth acting on now, and what would waiting cost?

Architecture Before Automation. Not whether. When, where and how.

Bring one workflow to your next review

Illustrative scenario and proposed decision worksheet

Scenario / A customer has to repeat the problem

A support assistant drafts a summary, but the receiving team cannot see the promise made by the previous agent. The service lead tests an internal, human-reviewed handoff before automating any new customer promise. The workflow owner supplies a trusted policy version and a named escalation contact.

Workflow and baseline

Name the workflow, owner and comparison period. Capture repeat contacts, resolution and rework.

Accepted outcome

Define what counts as resolved from the customer’s and operator’s perspectives.

Full operating cost

Include usage, ongoing support, review, exceptions, rework and recovery.

Authority and fallback

Identify who can approve, override or pause the action. Test the fallback under a real exception.

Decision date and cost of waiting

Choose scale, redesign, hold or stop. Name the missing evidence, owner and test date. Estimate repeat work or customer impact if the decision slips.

Apply this to one workflow. Explore the AI Opportunity Roadmap. Follow the live offer page for current availability.

Evidence, comparisons and limits

The December issue synthesizes four Friday–Thursday research cycles spanning October 30–November 26, 2026. The weekly method gives extra weight to the final 72 hours, prioritizes direct operator evidence and verifiable methods, and uses interested-source findings with corroboration. Each weekly index rates frequency, business impact, AI relevance, ParkWest fit, commercial trigger and momentum on a 1–10 scale, then normalizes the total to 100.

Comparisons use weekly editorial ranks. Survey figures retain their original populations and periods. Interviews, company disclosures and guidance support interpretation within their own contexts. Large-enterprise evidence is prominent, and the Thanksgiving week yielded fewer newly published items. The worksheet scenario is illustrative.

[1] Gartner / Customer service leaders and expected AI ROI / Nov 4, 2026
Survey of 275 customer service and support leaders, fielded July–August 2026. The measure is reported attainment of expected ROI.

[2] Airbnb / Q3 2026 shareholder letter / Nov 5, 2026
Company-reported support and cost metrics for Airbnb's own Q3 operations. A single operator case, with no cross-company or controlled causal comparison.

[3] Capgemini Research Institute / The Cost of Intelligence / Nov 12, 2026
September survey of 500 CXO-level leaders at large organizations. Vendor-sponsored. The 24% average applies to respondents that reported exceeding budget.

[4] The Adecco Group / Global Workforce of the Future 2026 / Nov 19, 2026
Survey of 40,500 workers in 36 countries and 21 industries, fielded June–July. Employer-sponsored survey. The comparison describes an association in reported willingness to adapt.

[5] Experian / Insight Avenue / Beyond the Model: The Power of Business Context in AI / November 2026
Online September survey of 500 technology, AI and data decision-makers in UK and Ireland organizations with 500 or more employees. Vendor-sponsored, respondent-defined access.

[6] IAASB / Quality management for AI-enabled technological tools / Nov 11, 2026
First staged guide for the audit and assurance context. Guidance on quality management responsibilities and risk assessment, with no survey population.
