

PANGEA

AI-Expeditor Quick Start Guide

FOUNDING CREATOR COHORT

Meet your in-app expeditor

The Pangea AI-Expeditor is the floating chat widget inside the platform. It helps creators find features, understand account data, prepare release metadata, manage virtual artists and channels, save recurring credits, and run supported studio tools.

WHO CAN USE IT: Creators and Admins

The expeditor is hidden from guests and listeners.

Start with these five prompts

- “Show me all my releases.”
- “Walk me through uploading my first release.”
- “Build my defaults profile from my past releases.”
- “Show me my virtual artist roster.”
- “Show me my channel details.”

What it can do for you

Ask it to...	What happens
Explain	Guides you through Pangea features and pages.
Look up	Reads your releases, artists, tracks, earnings, playlists, channel, and transcriptions.
Create or update	Prepares supported release, artist, channel, and metadata records.
Analyze	Runs BPM/key analysis or lyrics/chords transcription from an audio URL.

Create your first release with the expeditor

The expeditor can create a new release or Draft and pre-fill supported fields from your Creator Defaults. You remain responsible for reviewing the metadata and completing the unique release requirements.

1

Check your defaults

Ask: “Show me my saved metadata defaults.”

2

Create a Draft

Ask: “Create a Draft release titled ‘[title],’ genre [genre], and autofill the rest from my defaults.”

3

Review the form

Confirm names, credits, label details, AI tools, and other metadata.

4

Add unique codes

Enter fresh ISRC, ISWC, ASCAP, and BMI codes for this release.

5

Attach assets

Add the actual media file and cover artwork in the upload form.

NEVER AUTO-FILLED: ISRC • ISWC • ASCAP code • BMI code

The expeditor asks for these identifiers fresh every time. They are unique to the release and are not copied from earlier projects.

YOU ATTACH: Media file • Cover artwork

Use Creator Defaults to move faster

Creator Defaults can remember recurring songwriters, producers, label information, AI tools, film credits, and other repeated metadata. The expeditor always asks before saving anything new to this profile.

- “Build my defaults profile from my past releases.”
- “Update my defaults—my usual producer is now [name].”
- “Remember this new AI tool for future releases.”

Your essential prompt list

Releases & data

- “Show me all my releases.”
- “How many streams have my tracks gotten?”
- “Where do I see my stream earnings?”

Virtual artists

- “Create a new virtual artist named [stage name], genre [genre].”
- “Update my artist’s bio.”

Pangea TV

- “Update my channel bio to [text].”
- “Change my channel name to [name].”
- “Publish my channel.”

Studio tools

- “Analyze the BPM and key of this audio file: [URL].”
- “Transcribe the lyrics and chords from this audio file: [URL].”

Three things to remember

It uses real account records. If a lookup returns nothing, the expeditor tells you instead of guessing.

You approve new defaults. Recurring metadata is not added to your profile without confirmation.

Review before submitting. Check all pre-filled metadata and machine-generated analysis or transcription results.

PROMPT TIP: Be specific. Name the release, artist, track, playlist, or channel—and say whether you want an explanation, a lookup, or an action.

WELCOME, FOUNDING CREATORS

Ask. Create. Refine. Build the future of Pangea.
