- Great professor with a lot of knowledge on the subject!
- I feel like the book material was irrelevant to what was actually taught. Although I did thoroughly enjoy being taught how to use JMP, and I think it is a valuable tool to be taught. I feel that buying the book was a waste of time and money.
- I really like his lectures. I wish there was practice problems for the exam. The textbook format is HORRIBLE. I would prefer a no textbook course. His exam can be based of the videos and be equally acceptable. The homework is ok.
- I think that Professor Rad is doing a great job when it comes to the subject matter. He is more than willing to explain the subject different ways if someone is having trouble understanding. He has done a great job at preparing us for the tests and giving examples in the real world on how using JMP would help us.
- I think this class would've been easier to learn in person, but Prof. Rad does a great job of moving this course online with the help of videos in addition to our lectures.

- It is obvious professor Rad is very knowledgeable on the subject of data analysis and can teach it well. My only comment to add is while teaching online there are many tabs open and there is a lot of switching between them it can become a bit distracting and hard to follow at times.
- My only comment would be that in a remote environment, it would be even more helpful to give your student's a tiny heads up about the programs we will need to access for that day in class and take a tiny bit longer to ensure everyone has the program open before "jumping" in. ;)

At the current moment I have a hard time following along in jmp during lectures. I usually have to watch the recorded lecture later and pause the video as needed.

- The professor was very informative about the course and very understanding.
- This class is super helpful and I really love the fact that Prof. Rad helps us to go through the steps in each software like Excel and JMP during the class period. He also offers additional resources in the format of videos which are super helpful in case you missed a concept in class.
- This class was an fairly straightfoward and informative experience. I realize the combination of a shortened semester combined with the unfamiliarity with administering lessons in a online setting has made some limitations apparent. However, I don't feel as if my time was wasted with the course and I believe the professor did the best they could given his conditions. In the end I feel like I was challenged at an appropriate level and I feel as if the status quo of my prior knowledge about the subject was raised.

2. Optional Written Comments

2.1) What did you like about the course?

- How much of an advocate he seems like, for students. I love JMP. He is very nice and informative. Video lectures are great.
 - How real life examples were used to emphasize our learning in class.
 - I enjoyed the testing of this course. It was very straightforward and if you were prepared it was easy. No trick questions.
 - I like how supportive Prof. Rad is to his students' success in the class.
 - I like our use of jmp in the course, and all of the videos prepared for us for further review and to study.
 - I like that he makes a very complicated course as simple as possible. Clear instructions that leaves little room for uncertainty.
 - I liked learning how to use JMP to perform statistical analysis.
 - I liked that the professor presented things very simply and made concepts easy to understand. I also thought that the book he chose was really good and easy to comprehend.
 - I loved the practical applications to finance and managing, calculating beta and getting the data sets ourselves through yahoo finance was awesome.
 - I really enjoyed learning about JMP this class was the first time I had used it and professor Rad did a great job at providing instructions on how to use the software that was easy to understand.
 - I really like the Professor and topic.
 - I really liked learning JMP and developing that skillset, I honestly wish we learned more about JMP and it's capabilities. I really like that Dr. Rad has YouTube videos on different lecture topics available to go back to and watch as many times as a student feels they need to. With the exception of some of the misleading or vague wording of questions on the Pearson site, I like that you know what to expect for exams. It is extremely frustrating when professors turn courses into games to see how they can trick students to see if they are paying attention, maybe if this was an audit and assurance course, that would be suitable, but I don't see how that teaches a student effectively. Fortunately that is not the case with Dr. Rad, he gives lectures every week which I appreciate seeing as I've talked to a number of students taking other classes and many have said that their professors often don't even do live lectures and some have no lectures at all. I hope Dr. Rad continues to give live lectures to his classes as I think it is beneficial to the learning process and because the students did pay for it.
 - I think shorter videos on the lecture and how to use jump would be very helpful.
 - One aspect of the course I appreciated was the interactivity of the lessons. By that I mean the integration of JMP in the live lectures was very effective and the explanation of the mechanics of the program was fairly intuitive.
- I also appreciate the supplemental materials offered on the canvas page. The video lectures, PowerPoint files, and data files being readily available is very convenient. They also make study balance between all classes very manageable.
- The generous time allotments for HW is welcomed. And the exams are straightforward, as well as the integration of JMP within them.
- Professor Rad is a helpful and kind professor who cares for his students and wants them to succeed in his course. I like how the grading system is straight forward without leaving us to guess what our grade could be. The course also provides real life examples that help me understand how business data analysis is applied to the real world and in careers. I also like how a lot of extra credit is offered, giving me an opportunity to raise my grade.
 - The course offers helpful resources which I believe is useful in real life situations as well like evaluating Return and Risk of Stocks, for instance.
 - The pre-recorded videos have been helpful and the flexible due dates on the homework assignments have pulled a lot of stress off of me.
 - The skills I get from this course are useful and helpful for my future career.
 - There is substantial practice and application of the material so students are confident in learning the subject matter and succeeding on tests. I like how there are recorded videos which we can use to review if we want to practice or didn't understand the material the first time around.
 - Very straight forward from the beginning. Knows criteria of class.
